

**IN THE ABSTRACT:**

A substitute Abstract is attached hereto.

ABSTRACT

A hasp assembly is provided with prevents the door of a boxcar or a sea-going bin from accidentally opening. One end of the hasp is locked to the door jamb adjacent to the door. The other end of the assembly includes a U-shaped connector which is passed through an opening in a staple on the door in order to attach the connector to the door. The connector is re-attached to the shank of the hasp by a key which passes through keyways in the connector and the shank. To discourage vandalism or theft, the key can only be removed from the keyways by destroying it by a blow torch or hacksaw or by a special tool which is not available to the general public.
